

CBWTR Query Studio

An AI-Powered Query Tool for
Cross-Border Wire Transaction Intelligence

Financial Intelligence Unit

FIU-IND

July 10, 2026

The Challenge We Are Solving

Current Situation

- Analysts need to investigate suspicious wire transactions on a daily basis

The Challenge We Are Solving

Current Situation

- Analysts need to investigate suspicious wire transactions on a daily basis
- The database holds **up to 50 tables** with highly technical, coded column names

The Challenge We Are Solving

Current Situation

- Analysts need to investigate suspicious wire transactions on a daily basis
- The database holds **up to 50 tables** with highly technical, coded column names
- Every query requires a **technical expert** to write SQL causing delays

The Challenge We Are Solving

Current Situation

- Analysts need to investigate suspicious wire transactions on a daily basis
- The database holds **up to 50 tables** with highly technical, coded column names
- Every query requires a **technical expert** to write SQL causing delays
- Valuable investigation time is lost waiting for data pulls

The Challenge We Are Solving

Current Situation

- Analysts need to investigate suspicious wire transactions on a daily basis
- The database holds **up to 50 tables** with highly technical, coded column names
- Every query requires a **technical expert** to write SQL causing delays
- Valuable investigation time is lost waiting for data pulls

Impact on Operations

- Slow turnaround on STR and CBWTR report generation

The Challenge We Are Solving

Current Situation

- Analysts need to investigate suspicious wire transactions on a daily basis
- The database holds **up to 50 tables** with highly technical, coded column names
- Every query requires a **technical expert** to write SQL causing delays
- Valuable investigation time is lost waiting for data pulls

Impact on Operations

- Slow turnaround on STR and CBWTR report generation
- Analysts cannot explore data independently

The Challenge We Are Solving

Current Situation

- Analysts need to investigate suspicious wire transactions on a daily basis
- The database holds **up to 50 tables** with highly technical, coded column names
- Every query requires a **technical expert** to write SQL causing delays
- Valuable investigation time is lost waiting for data pulls

Impact on Operations

- Slow turnaround on STR and CBWTR report generation
- Analysts cannot explore data independently
- Critical red flags may be missed due to query bottlenecks

The Challenge We Are Solving

Current Situation

- Analysts need to investigate suspicious wire transactions on a daily basis
- The database holds **up to 50 tables** with highly technical, coded column names
- Every query requires a **technical expert** to write SQL causing delays
- Valuable investigation time is lost waiting for data pulls

Impact on Operations

- Slow turnaround on STR and CBWTR report generation
- Analysts cannot explore data independently
- Critical red flags may be missed due to query bottlenecks
- Dependency on IT team for routine data questions

The Challenge We Are Solving

Current Situation

- Analysts need to investigate suspicious wire transactions on a daily basis
- The database holds **up to 50 tables** with highly technical, coded column names
- Every query requires a **technical expert** to write SQL causing delays
- Valuable investigation time is lost waiting for data pulls

Impact on Operations

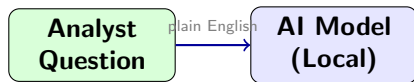

- Slow turnaround on STR and CBWTR report generation
- Analysts cannot explore data independently
- Critical red flags may be missed due to query bottlenecks
- Dependency on IT team for routine data questions

Goal: Enable *any* analyst to query the CBWTR database in plain English with no SQL knowledge required.

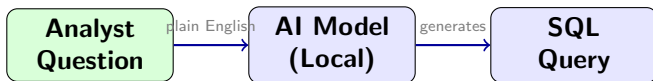

What We Have Built

**Analyst
Question**

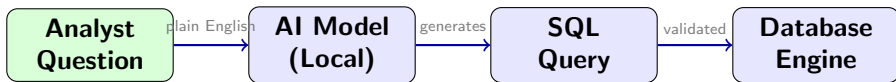

What We Have Built

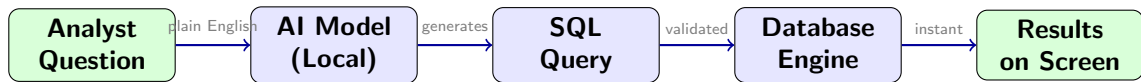

What We Have Built

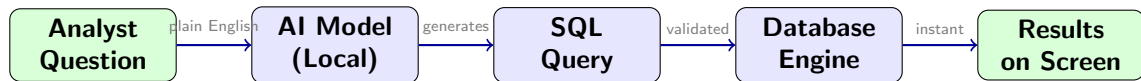

What We Have Built

What We Have Built

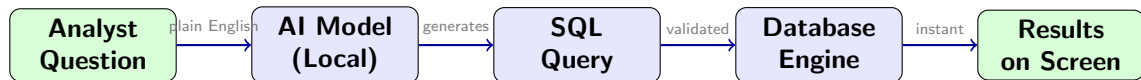

What We Have Built

AI at the Core

Uses **Qwen 2.5 Coder**, an AI model that runs entirely on local infrastructure no data leaves the organisation.

What We Have Built

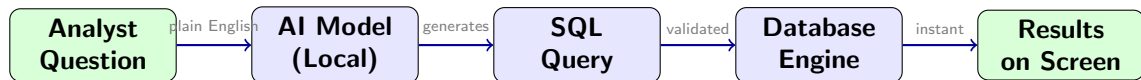

AI at the Core

Uses **Qwen 2.5 Coder**, an AI model that runs entirely on local infrastructure no data leaves the organisation.

Built-in Safety

Every query is automatically checked before execution. Write operations are **blocked at all times**.

What We Have Built

AI at the Core

Uses **Qwen 2.5 Coder**, an AI model that runs entirely on local infrastructure no data leaves the organisation.

Built-in Safety

Every query is automatically checked before execution. Write operations are **blocked at all times**.

Smart Table Selection

The tool automatically identifies which data tables are relevant to the analyst's question using semantic search.

Key Capabilities for Investigators

Analysts can now ask questions like:

Key Capabilities for Investigators

Analysts can now ask questions like:

- *“Show all wire transfers above 50 lakhs from China in the last 30 days”*

Key Capabilities for Investigators

Analysts can now ask questions like:

- *“Show all wire transfers above 50 lakhs from China in the last 30 days”*
- *“Which beneficiary accounts received more than 5 transactions this week?”*

Key Capabilities for Investigators

Analysts can now ask questions like:

- *“Show all wire transfers above 50 lakhs from China in the last 30 days”*
- *“Which beneficiary accounts received more than 5 transactions this week?”*
- *“List entities where UBO details are missing and risk level is High”*

Key Capabilities for Investigators

Analysts can now ask questions like:

- *"Show all wire transfers above 50 lakhs from China in the last 30 days"*
- *"Which beneficiary accounts received more than 5 transactions this week?"*
- *"List entities where UBO details are missing and risk level is High"*
- *"Find accounts that were frozen, show the reason for freeze"*

Key Capabilities for Investigators

Analysts can now ask questions like:

- *"Show all wire transfers above 50 lakhs from China in the last 30 days"*
- *"Which beneficiary accounts received more than 5 transactions this week?"*
- *"List entities where UBO details are missing and risk level is High"*
- *"Find accounts that were frozen, show the reason for freeze"*
- *"Show all KYC records where PAN is not available"*

Key Capabilities for Investigators

Analysts can now ask questions like:

- *"Show all wire transfers above 50 lakhs from China in the last 30 days"*
- *"Which beneficiary accounts received more than 5 transactions this week?"*
- *"List entities where UBO details are missing and risk level is High"*
- *"Find accounts that were frozen, show the reason for freeze"*
- *"Show all KYC records where PAN is not available"*

Results are displayed instantly with a **Download CSV** option for further analysis.

Key Capabilities for Investigators

Analysts can now ask questions like:

- *"Show all wire transfers above 50 lakhs from China in the last 30 days"*
- *"Which beneficiary accounts received more than 5 transactions this week?"*
- *"List entities where UBO details are missing and risk level is High"*
- *"Find accounts that were frozen, show the reason for freeze"*
- *"Show all KYC records where PAN is not available"*

Results are displayed instantly with a **Download CSV** option for further analysis.

Data Coverage

- **8** tables indexed so far

Key Capabilities for Investigators

Analysts can now ask questions like:

- *“Show all wire transfers above 50 lakhs from China in the last 30 days”*
- *“Which beneficiary accounts received more than 5 transactions this week?”*
- *“List entities where UBO details are missing and risk level is High”*
- *“Find accounts that were frozen, show the reason for freeze”*
- *“Show all KYC records where PAN is not available”*

Results are displayed instantly with a **Download CSV** option for further analysis.

Data Coverage

- **8** tables indexed so far
- **218 columns** with business descriptions

Key Capabilities for Investigators

Analysts can now ask questions like:

Results are displayed instantly with a **Download CSV** option for further analysis.

Data Coverage

- **8** tables indexed so far
- **218 columns** with business descriptions
- Covers transactions, KYC, entity details, account history, and GOS filings

Data Security

The AI model runs **fully on-premises**. No query, no data, and no result ever leaves the internal network.

Completed

- **AI model integrated** Qwen 2.5 Coder running locally, generating accurate SQL from plain English

Completed

- **AI model integrated** Qwen 2.5 Coder running locally, generating accurate SQL from plain English
- **Metadata indexing complete** all 218 columns annotated with business meaning, regulatory context (FATF, PMLA, RBI), and valid values

Completed

- **AI model integrated** Qwen 2.5 Coder running locally, generating accurate SQL from plain English
- **Metadata indexing complete** all 218 columns annotated with business meaning, regulatory context (FATF, PMLA, RBI), and valid values
- **Smart table suggestion** system recommends the right tables automatically as the analyst types

Progress & Road Ahead

Completed

- **AI model integrated** Qwen 2.5 Coder running locally, generating accurate SQL from plain English
- **Metadata indexing complete** all 218 columns annotated with business meaning, regulatory context (FATF, PMLA, RBI), and valid values
- **Smart table suggestion** system recommends the right tables automatically as the analyst types

Upcoming

- Connect to **live production database** (currently running on local spreadsheet data for testing)

Progress & Road Ahead

Completed

- **AI model integrated** Qwen 2.5 Coder running locally, generating accurate SQL from plain English
- **Metadata indexing complete** all 218 columns annotated with business meaning, regulatory context (FATF, PMLA, RBI), and valid values
- **Smart table suggestion** system recommends the right tables automatically as the analyst types

Upcoming

- Connect to **live production database** (currently running on local spreadsheet data for testing)
- Index remaining **tables** into the system

Progress & Road Ahead

Completed

- **AI model integrated** Qwen 2.5 Coder running locally, generating accurate SQL from plain English
- **Metadata indexing complete** all 218 columns annotated with business meaning, regulatory context (FATF, PMLA, RBI), and valid values
- **Smart table suggestion** system recommends the right tables automatically as the analyst types

Upcoming

- Connect to **live production database** (currently running on local spreadsheet data for testing)
- Index remaining **tables** into the system
- **End-to-end testing** with real analyst queries and sign-off
